April 2026

Dear Instacart,

Meals and health are among the most personal design spaces in consumer products. Food is identity, routine, care, and memory all at once. When a product gets that right, it does not just help people shop. It becomes part of how a household functions. Designing personalized experiences around meal planning, nutrition, and allergy management that earn that kind of trust, and that hold up week after week across an entire family's needs, is a design challenge I find genuinely compelling. It is what drew me to this role.

At the National Fire Protection Association, I have led design for a complex, information-dense product serving professionals in a highly regulated industry: a domain where trust is the baseline requirement and personalization means surfacing the right standard for the right jurisdiction at the right moment. The work has required me to design across high-visibility surfaces with competing priorities, translate ambiguous problem spaces into clear frameworks and shipped experiences, and partner closely with product, engineering, research, and data science through discovery, iteration, and delivery. I work in agile teams, contribute to roadmap and requirements conversations, and stay in the process through QA to ensure that what ships holds up in the real world.

The design challenge in the Meals and Health pod that I find most interesting is the lifecycle dimension. Getting a user to plan their first meal through Instacart is a different problem than building the habit that makes them come back every week. Designing for that arc, from the first interaction through onboarding, adoption, and the kind of trust that survives a substitution or a missed item, requires experience frameworks and journey thinking, not just screen design. I work at that level of abstraction before moving to flows and UI, and I carry both through delivery.

I bring strong Figma skills, deep experience with information architecture and content hierarchy, and a track record of synthesizing research into design opportunities that move cross-functional teams toward decisions. I use AI tools including Claude and Cursor as a regular part of my practice for research synthesis, rapid prototyping, and documentation, and I have genuine curiosity about how agentic and conversational interfaces can make personalized grocery experiences feel less like a feature and more like a trusted shortcut.

Food is one of the most meaningful parts of daily life, and Instacart's opportunity to shape how people engage with it, across meals, health goals, and the rhythms of a household, is exactly the kind of design problem worth doing well. I would welcome the chance to talk about what your team is working through and where I could contribute.

Thank you,
Keith Villanueva
